Total Culling Concept group, the solution

AED-CSG™

There is a big chance that it will not be possible to use shed gassing where a shed cannot be closed off or where stocks are too small. The CSG is a good solution when wanting to euthanise small stocks without many people coming into contact with living poultry.

The CSG is a modular system that consists of a number of small panels. This system can be placed around the poultry or the poultry can be driven into it. The gas is then turned on and the birds are euthanised quickly.

Because the panels are transparent, it is possible to maintain a good overview of the euthanisation process and it is easy to see when all of the birds are dead. Because the CSG uses very little gas in comparison with any of the other systems, this is the ideal method for areas where little CO₂ gas is available.
